Fluid Mechanics and Hydraulic Machines Through Practice and Solved Problems

**Introduction**

Understanding the principles of fluid mechanics is vital for professionals working in various

areas, from civil engineering to aeronautics. Hydraulic equipment are widespread, powering a multitude from generation systems to transportation infrastructure. This article aims to illuminate key concepts in fluid mechanics and hydraulic machines through solved problems, enhancing a more thorough comprehension of these significant subjects.

### **Main Discussion:**

Fluid mechanics is concerned with the characteristics of fluids—liquids and gases—in a variety of conditions. Central to this discipline are ideas like pressure, weight, thickness, and discharge. Understanding these variables is critical for assessing fluid motion in ducts, channels, and other systems.

One basic equation controlling fluid flow is the , which states that the mass flow remains constant along a streamline. This indicates that in a pipe of varying cross-sectional area, the fluid speed adjusts to maintain a steady flow. For example if the pipe , the fluid velocity increases.

Another important equation is Bernoulli's equation relates , , and height for an inviscid, incompressible fluid along a streamline equation is widely used to investigate fluid flow in

various applications, such as aircraft wing design. For instance the vertical force by an aircraft wing is partly attributable to {Bernoulli's principle}.

Hydraulic machines utilize the principles of fluid mechanics to transform force from one form to another frequently utilize compressors and similar equipment built to direct fluid motion. , a pump increases the head of a fluid, enabling its conveyance to various locations. , a water turbine converts the power of flowing liquid into work.

### **Solved Problems:**

**Problem 1:** A pipe having a diameter 10 cm transports water at a velocity of 5 m/s. What is the discharge?

**Solution:** The area of the pipe is  $A = \pi(d/2)^2 = \pi(0.05 \text{ m})^2 \approx 0.00785 \text{ m}^2$ . The volume flow  $Q = A \times v = 0.00785 \text{ m}^2 \times 5 \text{ m/s} = 0.03925 \text{ m}^3/\text{s}$ .

**Problem 2:** Water flows along a horizontal pipe that narrows. The pressure before the

narrowing is 100 kPa, and the speed is 2 m/s. If the size of the pipe reduces by half at the constriction, what is the pressure at the constriction provided an ideal, incompressible fluid?

**Solution:** This problem is readily solved using . Applying the equation and taking into account the , we can determine the force at the restriction. (Detailed calculation excluded for brevity.)
